

Ömer Çelik

Lead Developer | Enterprise systems architecture · Governed AI in software delivery

İzmir, Türkiye · omer@omercelik.dev · linkedin.com/in/omercelikdev · github.com/omercelikdev

SUMMARY

Lead Developer at DefineX, building enterprise software on .NET since 2018. Mostly the systems large organizations run on every day: order management, business process orchestration, and the integrations that hold them together. Owns systems from the first architecture decision until long after go-live. As team lead, sets the technical direction, agrees on standards with the team, reviews the work, mentors developers, and plans delivery so big changes reach production in small, safe steps.

EXPERIENCE

DefineX – Consulting, Technology & Labs · Aug 2019 – Present

Lead Developer · Mar 2024 – Present

Leading a large, multi-year order management transformation for a telecom operator. A legacy Conceptwave-based B2B ordering stack is being replaced with a .NET microservices platform, one service line at a time, until Conceptwave is retired. Leads both teams, 10+ engineers in total: the transformation team building the new platform, and the Conceptwave team that keeps the legacy system running through the transition.

Scope: the full order flow, from product catalog and quote to product order, decomposition into service orders and fulfilment, modeled on TM Forum Open APIs and integrated with the operator's downstream systems.

- Own the technical design end to end: Vue.js UI, API gateway, ASP.NET Core REST services, Camunda workflows, Kafka integration, PostgreSQL on OpenShift
- Build much of the foundation myself: the API gateway, shared building blocks for logging, caching and API clients, the Camunda integration and the task framework the order screens run on
- Shape the migration strategy: phased cut-overs, both systems running side by side, and behaviour verified before each switch, inside regulated change windows
- Deliver cut-overs on schedule without disrupting live order flows
- Built reusable assets alongside the modernization, so each new service line builds on the same catalog, ordering, workflow and integration components
- Set the implementation templates, code review, unit testing and quality standards both teams follow, and mentor the developers on both teams
- Stay hands-on in production with operations: performance, observability, defect triage
- Turn business requirements into delivery plans with business analysts and downstream system owners

Also contribute to pre-sales solution architecture for telecom and banking clients.

Senior Developer · Jan 2021 – Mar 2024

Full stack .NET developer on telecom B2B systems, delivering features from design to production.

- Built features end to end across ASP.NET Core Web APIs, Entity Framework Core, Vue.js and integrations with connected systems
- Took part in design discussions and code review
- Supported releases and resolved production issues

Developer · Aug 2019 – Jan 2021

.NET, C#, JavaScript, TypeScript, Vue.js

Developer · Accenture, İzmir · Aug 2018 – Aug 2019

Conceptwave, .NET, Vue.js, JavaScript

FOCUS

How regulated organizations can adopt AI in software delivery without losing control. Someone has to own what AI is allowed to do, and model access should go through a gateway, governed like any other API. Business rules, specifications and code should change together, so the documentation stays current and knowledge doesn't depend on one person. And the test strategy has to be strong enough to decide what reaches production, especially when a legacy system is being replaced. Hands-on with Claude Code, MCP servers and agent skills in open source work (Goldpath, SpecDrift).

OPEN SOURCE

Goldpath – AI-native, spec-driven enterprise .NET accelerator: composable libraries, templates, AI skills and guardrails on a paved golden path. github.com/qorpe/goldpath

SpecDrift – Deterministic spec lint for manifest-driven golden paths. Validates invariants, detects drift between spec and code, and speaks MCP. github.com/qorpe/specdrift

Mediant – CQRS mediator for .NET with the Result pattern, pipeline behaviors, Native AOT and OpenTelemetry. MIT-licensed alternative to MediatR. github.com/qorpe/mediant

Mockifyr – Self-hosted API mocking and integration sandbox. Multi-protocol, multi-tenant, one container. github.com/qorpe/mockifyr

QlipLab – Smart clipboard and text vault for everything you copy or type. github.com/omercelikdev/qliplab

SKILLS

.NET & backend: C#, .NET, .NET Core, ASP.NET, REST APIs, Entity Framework (EF) Core, Dapper ORM, Web Services, Microservices

Testing: Unit Testing, xUnit, Test Strategy

Architecture & leadership: Software Architecture, Solution Architecture, Technical Leadership, Mentoring, Agile, Scrum

Workflow & integration: Camunda BPM, Business Process Management, Apache Kafka, RabbitMQ, SignalR

Frontend: Vue.js, TypeScript, JavaScript, React.js

Data: PostgreSQL, Oracle Database

Cloud-native & DevOps: Red Hat OpenShift, Kubernetes, Docker, GitLab CI/CD, Git, Keycloak

Telecom: Telecommunications, Order Management, Conceptwave, TM Forum Open APIs

AI in delivery: Claude Code, Model Context Protocol (MCP), AI Agents, Agent Skills

EDUCATION

Yıldız Technical University · Bachelor of Science, Computer Engineering · 2018

LANGUAGES

Turkish (native) · English (full professional proficiency)
